

CLAIMS

What is claimed as being new and desired to be protected by LETTERS PATENT of the United States is as follows:

1. (Previously Presented) A sexual aid system for allowing a user to stimulate the upper vaginal wall without impinging on the therein contained urethra, comprising in combination:

a head portion having a bi-lobar configuration with a right lobe and a left lobe, the head portion having a tip with a linearly configured groove formed there between with the groove running the length of the head, from the tip of the head portion and inwardly, the head having a first external diameter;

a shaft portion comprising a length having a generally solid tubular configuration having a second external diameter, with the second external diameter being smaller than the first external diameter, the shaft portion being adjacent to the head portion with the shaft having a groove running contiguous with the groove of the bi-lobar head portion and running linearly along the length of the shaft from the outermost end of the head portion to the gripping portion; and

a gripping portion having a generally solid tubular configuration with a diameter being the same as the second external diameter, the gripping portion being adjacent to the shaft portion and opposite the head portion.

2. (Currently Amended) A sexual aid system comprising:

a head portion having a bi-lobar configuration with a right lobe and a left lobe, the head portion having a length, the head portion also having a groove running between the lobes, the groove running the length of the head portion, the head having a first external diameter;

a shaft portion being adjacent to the head portion, the shaft comprising a length having a generally solid tubular configuration having a second external diameter, the shaft having a groove running contiguous with the groove of the bi-lobar head portion; and

a gripping portion adjacent to the shaft portion and opposite the head portion and the gripping portion further including an enlarged annular flange between the shaft portion and the gripping portion,

the sexual aid being fabricated of borosilicate glass, the glass having an appreciate amount of oxide of boron to enhance the lubricity of the sexual aid system.
